DESCRIPTION

Hello, friend!

Hopefully, the last few days helped you to acquire new knowledge.

Efficiency is an extremely important component for both individual qualities, and development. It takes a long time to achieve maximum results, so we suggest shortening the path to success by learning function templates and iterators. They are powerful tools in C++ that greatly simplify the job of a programmer if you use them in the complex.

For example, a function template saves a lot of time because writing a template is a one-time procedure and it can be used with different types of data. Once you get used to writing function templates, you will understand that it takes no more than writing one regular function. A function template makes it much easier to support code later and it is safer since you don't have to manually overload a function by copying the code and changing only data types when you need new data type support.

Also, the use of iterators can avoid intermediate variables, lead to shorter code, consume less memory, run faster, the code is more modular and beautiful. So, this practice provides an opportunity to improve your coding skills rapidly faster.

Remember that the main goal is no longer to do more, but rather - to do less. You will need it in the future.

JUST DO IT!

BIG TOGA

Productivity.

GSSENTIAL QUESTION

How to achieve max efficiency during C++ code development?

Challenge

Create specified function templates.

Investigate

GUIDING QUESTIONS

We invite you to find answers to the following questions. By researching and answering them, you will gain the knowledge necessary to complete the challenge. To find answers, ask the students around you and search the internet. We encourage you to ask as many questions as possible. Note down your findings and discuss them with your peers.

- What skills are important for a successful programmer?
- What are the benefits of using function templates?
- What is the syntax of a function template?
- What are the use cases of std::istream_iterator?
- What are the use cases of std::input_iterator_tag?
- What operations does std::input_iterator_tag support?
- What does std::ostream_iterator template describe?
- What are the use cases of std::output_iterator_tag?
- What are the use cases of std::forward_iterator_tag?
- Which iterator can be used to access the sequence of elements in a range in both directions (end and beginning)?
- What are the use cases of std::random_access_iterator_tag ?
- In what cases is it better not to use the template functions?

GUIDING ACTIVITIES

Complete the following activities. Don't forget that you have a limited time to overcome the challenge. Use it wisely. Distribute tasks correctly.

- Read the tasks carefully and try to find as much information as possible about them.
- \bullet Consider the algorithms found in the tasks.
- Allocate your resources and time.
- Use your research to carry out the tasks below.
- Open the story and read.
- \bullet Arrange to brainstorm tasks with other students.
- · Clone your git repository that is issued on the challenge page in the LMS.
- Try to implement your thoughts in code.
- Push the solution to the repository.

ANALYSIS

Analyze your findings. What conclusions have you made after completing guiding questions and activities? In addition to your thoughts and conclusions, here are some more analysis results.

• Be attentive to all statements of the story.

- Analyze all information you have collected during the preparation stages. Try to define the order of your actions.
- Perform only those tasks that are given in this document.
- Submit your files using the layout described in the story. Only useful files allowed, garbage shall not pass!
- Tasks in **shell** must be executed with **zsh**.
- Compile files with commands cmake . -Bbuild && cmake --build ./build that will call CMake and build an app.
- Pay attention to what is allowed in a certain task. Use of forbidden stuff is considered a cheat and your tasks will be failed.
- Complete tasks according to the rules specified in the Google C++ Style Guide.

 But there are several exceptions for the guide listed below:
 - you can use #pragma once directive instead of #ifndef ... #define
 - variables can be written in mixed case
 - class data members must begin with m_ prefix (m for member)
 - indent 4 spaces at a time
- The solution will be checked and graded by students like you. Peer-to-Peer learning.
- If you have any questions or don't understand something, ask other students or just Google it.
- In the name of Talos, use your brain!

NAME

Template Addition

DIRECTORY

t00/

SUBMIT

templateAddition.h

DESCRIPTION

Create a function template add with two parameters that compiles with the given main.cpp from the SYNOPSIS. If parameters are strings, it concatenates them. If parameters are numeric, it adds them the mathematically.

RETURN

Returns the result of addition of two parameters.

SYNOPSIS

```
#include "templateAddition.h"

#include <iostream>
#include <string>

int main() {
    double d1 = 3;
    double d2 = 4.3;
    std::cout << add(d1, d2) << std::endl;

    std::string s1 = "Hello";
    std::string s2 = " there";
    std::cout << add(s1, s2) << std::endl;
    return 0;
}</pre>
```

CONSOLE OUTPUT

```
>./templateAddition
7.3$
Hello there$
>
```

SEE ALSO

Templates

NAME

Output Any

DIRECTORY

t01/

SUBMIT

outputAny.h

DESCRIPTION

Create a function template outputAny that prints the contents of a container to the standard output. One item per line. The function template must work correctly with all containers except those, where the iterator points to a pair.

SYNODSTS

template <class Container>
void outputAny(const Container& c);

NAME

Sum Of Arguments

DIRECTORY

t02/

SUBMIT

sumOfArguments.h

DESCRIPTION

Create a template function sumOfArguments that takes a varying number of arguments as a parameter and sums them up.

RETURN

Returns the sum of a varying number of arguments.

SYNOPSIS

```
template <class T, class ...Ts>
T sumOfArguments(T t, Ts... args);
```

NAME

Sum File Data

DIRECTORY

t03/

SUBMIT

sumFileData.h

DESCRIPTION

Create a function template that takes a file name as a parameter. The file may contain integers or doubles separated by a single space. The file contents will always be valid, no need for error handling.

```
Use std::istream_iterator for the solution
```

RETURN

Returns the sum of numbers listed in the file.

SINOPSIS

```
template <class T>
T sumFileData(const std::string& fileName);
```

CONSOLE OUTPUT

```
>cat intExample_1.txt | cat -e
1 2 3 4 5$
>./sumFileData intExample_1.txt | cat -e
15$
>cat doubleExample_1.txt | cat -e
0.1 0.2 0.3 0.4 0.5$
>./sumFileData doubleExample_1.txt | cat -e
1.5$
>cat intExample_2.txt | cat -e
0 1 2 3.1 4.2 5.3$
>./sumFileData intExample_2.txt | cat -e
6$
>cat doubleExample_2.txt | cat -e
0 1 2 3.1 4.2 5.3$
>./sumFileData doubleExample_2.txt | cat -e
15.6$
>
```

SEE ALSO

std::istream_iterator
Input iterator

NAME

Output Container

DIRECTORY

t04/

SUBMIT

outputContainer.h

DESCRIPTION

Create a function template outputContainer that prints the contents of a container to the standard output. One item per line.

Use std::ostream_iterator for the solution.

SYNOPSIS

```
template <typename Container>
void outputContainer(const Container& container);
```

CONSOLE OUT PUT

```
>./outputContainer | cat -e
1$
9$
8$
6$
>
```

SEE ALSO

std::ostream_iterator Output iterator

NAME

Square Value

DIRECTORY

t05/

SUBMIT

squareValue.h

DESCRIPTION

Create a function template squareValue that iterates over a container's contents and squares its values.

SYNOPSIS

template <class Container>
void squareValue(Container& container);

see also

Forward iterator

NAME

Is Palindrome

DIRECTORY

t06/

SUBMIT

isPalindrome.h

DESCRIPTION

Create a function template isPalindrome that takes two iterators as parameters and checks if they contain a palindrome.

For example, { 1, 2, 3, 2, 1 }, { 0.1, 0.2, 0.3, 0.2, 0.1 }, "radar" are palindromes.

RETURN

Returns true if it is a palindrome, and false otherwise.

SYNOPSIS

template <class BidirectionalIterator>
bool isPalindrome(BidirectionalIterator begin, BidirectionalIterator end);

SEE ALSO

Bidirectional iterator

NAMG

Sort Values

DIRECTORY

t.07/

SUBMIT

sortValues.h

DESCRIPTION

Create a function template sortValues that sorts the iterator values in ascending order. The usage of standard functions for sorting is FORBIDDEN, you must implement a sorting algorithm by yourself.

RETURN

Returns an iterator to the beginning of a sorted range.

SYNOPSIS

template <class RandomAccessIterator>

RandomAccessIterator sortValues(RandomAccessIterator begin, RandomAccessIterator end);

SEE ALSO

Random-access iterator

Share

PUBLISHING

Last but not least, the final stage of your work is to publish it. This allows you to share your challenges, solutions, and reflections with local and global audiences. During this stage, you will discover ways of getting external evaluation and feedback on your work. As a result, you will get the most out of the challenge, and get a better understanding of both your achievements and missteps.

To share your work, you can create

- a text post, as a summary of your reflection
- charts, infographics or other ways to visualize your information
- a video, either of your work, or a reflection video
- an audio podcast. Record a story about your experience
- a photo report with a small post

Helpful tools:

- Canva a good way to visualize your data
- QuickTime an easy way to capture your screen, record video or audio

Examples of ways to share your experience:

- Facebook create and share a post that will inspire your friends
- YouTube upload an exciting video
- GitHub share and describe your solution
- Telegraph create a post that you can easily share on Telegram
- Instagram share photos and stories from ucode. Don't forget to tag us :)

Share what you've learned and accomplished with your local community and the world. Use #ucode and #CBLWorld on social media.
